

## What am I saving with the PBX from PointCA?

Last Updated Wednesday, 08 August 2007

With the private branch exchange from PointCA Télécom, you save immediately!

Indeed, a standard telephone exchange that includes the same functions is 2 to 3 times more expensive on average, and often without even integrating Internet telephony (or VoIP).

However, the savings are done on several levels:

- Immediate cost: The immediate cost is divided in two on average, for similar traditional equipment (PBX including 4 to 8 voice mailboxes);
- Long distance savings: If you use IP telephones connected outside of your business, for your sellers in the regions for example, or your satellite offices, you will make a general saving on all the communication costs. Furthermore, if you have several PBX systems from PointCA Telecom interconnected with each other, you will save even more!
- No surprises: There are no additional licenses or electronic cards to purchase in order to add options, it is all there!
- Infrastructure: There is no parallel cabling to perform for each telephone station since you are employing the same cabling used with your business internet network;
- Simplified maintenance: You have access in real time, via an interface, to your PBX entire configuration. You can become the specialist of you exchange.
- Consolidation: There is one specialist to call only, your computer specialist. He will take care of it and not an external specialized company. You will save the cost of a person for each modification of your PBX!
- Respect of your environment: The PBX consumes 5 to 10 Watts in energy only. A computer server, a PC or a traditional private automatic branch exchange can consume, on the other hand, one to several hundreds of Watts;
